

We decided to go with a basic way to approach this problem, making it easier to read and understand

We start with a user's node which gets 2 options the isa user type in which we decide what kind of user we are dealing with and a Task one which keeps the info of a task, this one is connected to an ISA which decides that kind of tasks we are having work related or personal problems but also Reminders and Task Status. Task Status is for watching the progress of one or more tasks and reminders is connected to another ISA which gives the data base 2 options to send a reminder via email or via SMS.

This approach is clear and easy to understand for everyone even if you don't have knowledge in databases or schemas regarding databases.
